Screens and Fine Screens

Coarse Screen

Fine Screen

Perforated Plate Screen

Mesh Screen

Reliable screens for any application

Fine and micro screens for separation of fine suspended material

Innovative technology from one source

Mechanical treatment is indispensable as the first process step of preliminary treatment of wastewater, both for STP inlets and other fields of application, such as process water treatment.

Disturbing coarse material has to be removed in order to protect the subsequent steps against damage/pollution or to relieve them. It is the goal to completely separate floating, settling and suspended material, depending on the bar spacing, and remove the material prior to discharging it into a container.

The hygienic conditions, operation safety and the fact that there are nearly any maintenance works are factors becoming more and more important.

For municipal STPs an additional screenings washing is recommendable as regards the denitrification, in order to lead the soluble organics again to biological treatment.

Benefits

The HUBER screening program comprises thus a wide variety of screen systems and enables us to offer the perfect solution for

- any installation conditions
- any flow rate
- any bar spacing
